

ABSTRACT OF THE DISCLOSURE

5 This image pickup device has: an image pickup element having a photoreceiving face; a plurality of lenses for receiving light entering from different directions; a mirror as travel direction changing means for changing a travel direction of light as necessary so that light passed through the lenses travels toward the photoreceiving face; and a light shield plate for substantially dividing a space where images are formed so that light fluxes entering from the lenses and forming images on the photoreceiving face are not overlapped with each other.
